Dissection Procedure Overview

The frog dissection process involves several systematic steps to ensure safe handling and thorough examination:

- Preparation and Safety Measures: Wearing gloves and goggles, setting up the dissection tray, and ensuring all tools are sterilized.
- Positioning the Frog: Placing the frog dorsal side up on the tray and pinning limbs to stabilize the specimen.
- Initial Incisions: Making a midline incision along the ventral side from the cloaca to the chin, carefully cutting through the skin and abdominal muscles.
- Exposure of Internal Organs: Using dissection tools to lift and examine organs, removing tissues as needed for better visibility.
- Identification and Examination of Organ Systems: Systematically exploring each organ system and documenting observations.
- Cleanup: Proper disposal of specimens and cleaning tools for safety and hygiene.

Major Organ Systems in the Frog

Circulatory System

The frog's circulatory system is a closed, three-chambered heart comprising two atria and one ventricle. This setup allows for mixing oxygenated and deoxygenated blood, which is typical of amphibians.

Key features include:

- Heart Location: Situated near the front of the body, just behind the sternum.
- Major Vessels:
- Aorta: Distributes oxygenated blood to the body.
- Vena Cavae: Return deoxygenated blood from the body.
- Pulmonary arteries and veins: Connect lungs and heart, facilitating gas exchange.
- Function: Pump blood to transport nutrients, gases, and waste products.

Respiratory System

Frogs respire through both lungs and skin, a process called cutaneous respiration.

Key points:

- Lungs: Paired, sac-like organs located in the thoracic cavity.
- Skin: Moist and highly vascularized, allowing gas exchange directly with the environment.
- Nasal Cavity and Glottis: Structures involved in breathing and vocalization.

Digestive System

The frog's digestive system is a straight tube with specialized organs for ingestion, digestion, absorption, and elimination.

Main organs include:

- Mouth and Tongue: Used for capturing prey.
- Esophagus: Connects mouth to stomach.
- Stomach: Breaks down food; located on the left side.
- Small Intestine: Nutrient absorption.
- Liver: Produces bile and aids in digestion.
- Gallbladder: Stores bile.
- Pancreas: Produces digestive enzymes.
- Cloaca: Common chamber for waste elimination and reproductive activities.

Excretory System

The kidneys are the primary excretory organs in frogs.

- Kidneys: Located along the dorsal body wall.
- Ureters: Carry waste from kidneys to the cloaca.
- Urinary Bladder: Stores urine temporarily before excretion.

Reproductive System

Frogs are sexually dimorphic; males and females have distinct reproductive organs.

- Males:

- Testes: Located near the kidneys.
- Vas Deferens: Transports sperm.
- Females:
- Ovaries: Contain developing eggs.
- Oviducts: Transport eggs to the cloaca.

Nervous System

The frog's brain and spinal cord coordinate sensory input and motor functions.

- Brain: Consists of forebrain, midbrain, and hindbrain.
- Spinal Cord: Extends along the dorsal side.
- Nerves: Emanate from the spinal cord to limbs and other parts.

Observations During Dissection

Students should document:

- The size, shape, and position of organs.
- Any visible blood vessels or tissue differences.
- The texture and color of organs.
- The point of attachment of organs to each other.

Common Challenges and Precautions

- Fragile tissues: Handle tissues gently to prevent tearing.
- Contamination: Use gloves and sterilized tools.
- Specimen preservation: Use proper storage solutions if necessary.
- Ethical considerations: Ensure humane treatment and proper disposal.

Conclusion

The frog dissection in lab report 33A offers invaluable insights into vertebrate anatomy and physiology. By systematically exploring and identifying the major organs and organ systems, students gain a deeper understanding of biological functions and evolutionary relationships. This hands-on experience fosters skills in scientific inquiry, critical thinking, and ethical research practices. Mastery of dissection techniques and anatomical knowledge gained from this lab prepares students for advanced studies in biology and related fields.
