Detailed Breakdown of Common Questions and Their Answers in Module 14

- Newton?s First Law of Motion

Q: What is Newton?s First Law of Motion, and how does it relate to inertia?

A: Newton's First Law states that an object at rest stays at rest, and an object in motion stays in motion at a constant velocity unless acted upon by an external force. This law highlights the concept of inertia?the tendency of an object to resist changes in its state of motion. The greater the mass of an object, the higher its inertia.

- Newton?s Second Law of Motion

Q: How is Newton?s Second Law expressed, and what does it mean?

A: Newton's Second Law is mathematically expressed as F = ma, where F is force, m is mass, and a is acceleration. It indicates that the acceleration of an object depends directly on the net force acting upon it and inversely on its mass. This law explains how forces influence the motion of objects.

- Types of Forces and Their Examples

Q: List and describe the main types of forces encountered in physical science.

A: Common forces include:

- Gravity: The force pulling objects toward the Earth; responsible for weight.
- Friction: The force opposing motion between two surfaces; e.g., sliding friction.
- Tension: The force transmitted through a string or cable when pulled.
- Normal Force: The support force exerted by a surface perpendicular to the object.
- Applied Force: Any force applied to an object by a person or another object.

- Work and Power

Q: Define work and power, and explain their relationship.

A:

- Work is done when a force causes displacement of an object in the direction of the force, calculated as Work = Force x Distance x cos(?), where ? is the angle between force and displacement.
- Power measures how quickly work is done, calculated as Power = Work / Time. High power indicates work is done rapidly.

- Energy Conservation Principles

Q: What is the law of conservation of energy, and how does it apply to physical systems?

A: The law states that energy cannot be created or destroyed but only transformed from one form to another. In physical systems, this principle explains phenomena such as potential energy converting into kinetic energy during motion, or energy loss due to friction.

- Momentum and Collisions

Q: How is momentum defined, and what happens during elastic and inelastic collisions?

A:

- Momentum is the product of an object?s mass and velocity (p = mv).
- In elastic collisions, both momentum and kinetic energy are conserved.
- In inelastic collisions, momentum is conserved, but kinetic energy is not; some energy dissipates as heat or deformation.

- Simple Machines and Mechanical Advantage

Q: Describe the six types of simple machines and how they provide mechanical advantage.

A: The six simple machines are:

- Lever
- Inclined plane
- Wheel and axle
- Pulley
- Screw
- Wedge

Mechanical advantage (MA) indicates how much a machine amplifies force or distance. It is calculated as the ratio of output force to input force. For example, a lever increases force applied through the fulcrum, reducing effort.
